Version Oct 2019

Versafire Packaging Applications. **Substrate Variety.**

Use Case

Versafire is a highly flexible print system that allows printing on a wide range of substrates with different paper weights. A reliable engine in combination with a comfortable media-setup and user-friendly media management is the foundation for this flexibility.

When printing short run packaging applications on Versafire, the customer may choose from a large variety of different paper types. This allows the customer more flexibility in their design options and respective offering. Especially when printing on expensive or special papers, the engine delivers a high image quality without generating waste sheets.

Furthermore, Heidelberg offers media trainings to enhance the operators' knowledge on the engine settings and how to handle this substrate range.

Packaging Job 3: Substrate Variety
